SIMILARITY: TO ANP-A AND ANP-B RECEPTOR IN THEIR EXTRACELULAR AND TRANSMEMBRANE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MOI. Cell. Biol. 17:1503-1512(1997).
--- FUNCTION: RECEPPOR FOR ATRIAL NATRIURETIC PEPTIDE. DOES NOT HAVE GUANYLATE CYCLASE ACTUTTY.
--- SUBUNIT: HOMODIMER; DISULFIDE-LINKED (BY SIMILARITY).
--- SUBCELLAUGA LOCATION: TYPE I membrane proctsin.
--- SIBCELLAMEDOUS: THERE SEEM TO BE AT LEAST THERE ANP RECEPTORS: TWO WITH GUANYLATE CYCLASE ACTIVITY (ANP-A AND ANP-B) AND ONE (ANP-C)
15-JUL-1998 (Rel. 36, Created)
16-OCT-2001 (Rel. 40, Last sequence update)
16-OCT-2001 (Rel. 40, Last annotation update)
Atrial natriuretic peptide clearance receptor precursor (AND-C)
(ANPRC) (NPR-C) (Atrial natriuretic peptide C-type receptor) (EF-2).

Biophys. Acta 1398:243-255(1998).

-II- FUNCTION: CYTOCHROMES P450 ARE A GROUP OF HEME-THIOLATE
MONOOXYGENASES. THEY OXIDIZE A VARIETY OF STRUCTURALLY UNRELATED
COMPOUNDS, INCLUDING STEROIDS, FATTY ACIDS, AND XENOBIOTICS.
-II- SIMILARITY: BELONGS TO THE CYTOCHROME P450 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EMBL; U12678; AAC28889.1;

TISSUE SPECIFICITY: EXPRESSED IN DIFFERENTIATING NEURONS OF
BOTH THE CENTRAL AND PERIPHERAL NERVOUS SYSTEMS.
DEVELOPMENTAL STACE: EXPRESSED DURING EMBRYONIC DEVELOPMENT.
SIMILARITY: BELONGS TO THE BASIC HELIX-LOOP-HELIX (BHLH) FAMILY
TRANSCRIPTION FACTORS. "ATONAL" SUBFAMILY.
                                                                                                                                                                                                              FUNCTION: ACTS AS A DIFFERENTIATION FACTOR DURING NEUROGENESIS.
TRANSCRIPTIONAL ACTIVATOR. BINDS TO THE INSULIN GENE E-BOX.
SUBUNIT: EFFICIENT DNA BINDING REQUIRES DIMERIZATION WITH ANOTHER
BILL PROTEIN. HETERODIMER WITH E47.
SUBCELLULAR LOCATION: Nuclear (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            39

1- FUNCTION: ACTS AS A DIFFERENTIATION FACTOR DURING NEUROGENESIS.

TRANSCRIPTIONAL ACTIVATOR. BINDS TO THE INSULIN GENE E-BOX.

1- SUBUNIT: EFFICIENT DNA BINDING REQUIRES DIMERIZATION WITH ANOTH BHLH PROTEIN. HETERODIMER WITH E47.

1- SUBCELLULAR LOCATION: Nuclear (Potential).

1- SIMILARITY: BELONGS TO THE BASIC HELLY-LOOP-HELIX (BHLH) FAMILY TRANSCRIPTION FACTORS. "ATONAL" SUBFRMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PROSITE; PS00782; TFIIB; 2.
Transcription regulation; Repeat; Zinc-finger; Metal-binding; Zinc;
Submitted (JUL-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: STABLILIZES THP BINDING TO AN ARCHAEAL BOX-A PROMOTER.
-- ALSO RESPONSIBLE FOR RECRING RNA POLYMERASE II TO THE PRE-
INITIATION COMPLEX (DNA-TBP-TFILE) (BY SIMILARITY).
-!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
-!- SIMILARITY: BELONGS TO THE TFILE FAMILY.

-i- TISSUE SPECIFICITY: MOST ABUNDANT IN PANCREATIC ALPHA- AND BETA-
CELLS, LESS IN BRAIN AND INTESTINE.
-i- SIMILARITY: BELONGS TO THE BASIC HELIX-LOOP-HELIX (BHLH) FAMILY OF
TRANSCRIPTION FACTORS. "ATONAL" SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDLINE-95293222; PubMed-7774807;

Naya F.J., Stellrecht C.M.M., Tsai M.-J.;

Naya F.J., Stellrecht C.M.M., Tsai M.-J.;

"Issue-specific regulation of the insulin gene by a novel basic helix-loop-helix transcription factor.";

Genes Dev. 9:1009-1019(1995).

-!-FUNCTION: ACTS AS A DIFFPRENTIATION FACTOR DURING NEUROGENESIS.

TRANSCRIPTIONAL ACTIVATOR. BINDS TO THE INSULIN GENE E-BOX.

-!- SUBUNIT: EFFICIENT DNA BINDING REQUIRES DIMERIZATION WITH ANOTHER BHLH PROTEIN. HETERODIMER WITH E47.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SYNAPTIC TERMINALS.

-1- ALTERNATIVE PRODUCTS: 2 ISOFORMS; SIF TYPE 1 (SHOWN HERE) AND S TYPE 2 (AC P91620); ARE PRODUCED BY ALTERNATIVE SPLICING.

-1- DEVELOPMENTAL STAGE: AT STAGE 14, EXPRESSION OCCURS IN EACH SEGMENT OF THE CENTRAL NERVOUS SYSTEM. AT STAGE 17, EXPRESSION BECOMES RESTRICTED TO THE SYNAPTIC REGIONS OF THE BRAIN AND VENTRAL NERVE CORD, WHERE SYNAPSES UNDERGO MATURATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -! - SUBCELLULAR LOCATION: LOCALIZES TO THE SUBMEMBRANOUS REGION OF

                     SUDMITTED (NOV-2000) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: ACTIN-BINDING PROTEIN INVOLVED IN THE REGULATION OF BURDAL PROCESS FORMATION AND IN DIFFEREMENTATION OF NEURAL CREST CELLS. MAY BE DOWN-REGULATED IN NETROBLASTOMA TUMORS.

-!- SUBUNIT: BINDS TO RBI. HYPOPHOSPHORYLATED RBI ASSOCIATES WITH ENCIDENTS NEURONAL DIFFERENTIATION, WHILE HYPERPHOSPHORYLATED RBI.

-!- SUBCELLULAR LOCATION: NOULEAR. MATRIX-ASSOCIATED.
-!- SUBCELLULAR LOCATION: NUCLEAR. NUCLEAR MATRIX-ASSOCIATED.
-!- TISSUE SPECIFICITY: DETECTED IN FETAL BRAIN TISSUE, MODERATE EXPRESSION IN FETAL HEARY, LUNG AND KIDNEY. HIGHLY EXPRESSED IN ADULT BRAIN, PARTICULARLY HIGH IN THE HIPPOCAMPUS AND AMYGDALA, AND SPINAL CHORD. DETECTABLE IN ADULT PANCREAS.
-!- DEVELOPMENTAL STAGE: DRAMATICALLY UPREGULATED UPON NEURONAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -!- PTM: PHOSPHORYLATED.

                            20011227
     Novel exendin and exendin agonist compd. formulations and dosages and
AΒ
     methods of administration thereof are provided. These compns. and methods
     are useful in treating diabetes and conditions that would be benefited by
     lowering plasma glucose or delaying and/or slowing gastric emptying or
     inhibiting food intake.

    Novel modified exendins and exendin agonists having an exendin or exendin
    agonist linked to one or more polyethylene glycol polymers, for example,
    and related formulations and dosages and methods of administration thereof
    are provided. These modified exendins and exendin agonists, compns. and
    methods are useful in treating diabetes and conditions that would be
    benefited by lowering plasma glucose or delaying and/or slowing gastric
     emptying or inhibiting food intake.

     Methods are provided for use of an exendin, an exendin agonist, or a
AΒ
     modified exendin or exendin agonist having an exendin or exendin agonist
     linked to one or more polyethylene glycol polymers, for example, for
     lowering glucagon levels and/or suppressing glucagon secretion in a
     subject. These methods are useful in treating hyperglucagonemia and other
     conditions that would be benefited by lowering plasma glucagon or
     suppressing glucagon secretion.

     Novel exendin and exendin agonist compd. formulations and dosages and
     methods of administration thereof are provided. These compns. and methods
     are useful in treating diabetes and conditions that would be benefited by
     lowering plasma glucose or delaying and/or slowing gastric emptying or
     inhibiting food intake.

    Methods for increasing urine flow are disclosed, comprising administration
AΒ
    of an effective amt. of GLP-1, an exendin, or an exendin or GLP-1 agonist.
    Methods for increasing urinary sodium excretion and decreasing urinary
    potassium concn. are also disclosed. The methods are useful for treating
    conditions or disorders assocd. with toxic hypervolemia, such as renal
    failure, congestive heart failure, nephrotic syndrome, cirrhosis,
    pulmonary edema, and hypertension. The present invention also relates to
    methods for inducing an inotropic response comprising administration of an
    effective amt. of GLP-1, an exendin, or an exendin or GLP-1 agonist.
    These methods are useful for treating conditions or disorders that can be
    alleviated by an increase in cardiac contractility such as congestive
    heart failure. Pharmaceutical compns. for use in the methods of the
    invention are also disclosed.

     Methods for treating conditions or disorders which can be alleviated by
AB
     reducing food intake are disclosed which comprise administration of an
     effective amt. of an exendin or an exendin agonist, alone or in
     conjunction with other compds. or compns. that effect satiety. Approx.
     180 exendin-related peptides were synthesized by the solid-phase method.

    MARPAT 128:192936
    Methods for reducing gastric motility and delaying gastric emptying for
AB
    therapeutic and diagnostic purposes are disclosed which comprise
    administration of an effective amt. of an exendin or an exendin agonist
    H-Xaa1-Xaa2-Xaa3-Gly-Thr-Xaa4-Xaa5-Xaa6-Xaa7-Xaa8-Ser-Lys-Gln-Xaa9-Glu-Glu-
    Glu-Ala-Val-Arg-Leu-Xaa10-Xaa11-Xaa12-Xaa13-Leu-Lys-Asn-Gly-Gly-Xaa14-Ser-
    Ser-Gly-Ala-Xaa15-Xaa16-Xaa17-Xaa18-Z [Xaa1 = His, Arg, Tyr; Xaa2 = Ser,
    Gly, Ala, Thr; Xaa3, Xaa7, Xaa12 = independently Asp, Glu; Xaa4, Xaa10 =
    independently Phe, Tyr, naphthylalanine; Xaa5, Xaa6 = independently Thr,
```

Ser; Xaa8, Xaa9 = independently Leu, Ile, Val, pentylglycine, Met; Xaal1 = any group Xaa8, tert-butylglycine; Xaa13 = any group Xaa4, Trp; Xaa14-Xaa17 = independently Pro, homoproline, 3-Hyp, 4-Hyp, thioproline, N-alkylqlycine, N-alkylpentylqlycine, N-alkylalanine; Xaal8 = Ser, Thr, Tyr; Z = OH, NH2; with the proviso that the compd. does not have the formula of exendin-3 or exendin-4] or a pharmaceutically acceptable salt thereof. Methods for treating conditions assocd. with elevated, inappropriate, or undesired post-prandial blood glucose levels are disclosed which comprise administration of an effective amt. of an exendin or an exendin agonist alone or in conjunction with other anti-gastric emptying agents. Thus, exendin-4 acid and [Leu14, Phe25] - exendin-4, prepd. by std. solid-phase methods on a 4-(2,4-dimethoxyphenyl)-Fmocaminomethylphenoxyacetamide norleucine-MBHA resin using 9-fluorenylmethoxycarbonyl (Fmoc)-protected amino acids, inhibited gastric emptying in male HSD rats with EC50 = 0.12 and 0.29 .mu.g. Exendin-4 showed EC50 = 0.27 .mu.g under the same conditions.

     The present invention relates to methods of treating intermittent
AΒ
     claudication comprising administering glucagon-like peptide-1 (GLP-1)
    mols. to subjects suffering therefrom. A method of treating or preventing
     skeletal muscle injury caused by ischemia and/or reperfusion in a subject
     comprising the step of administering a therapeutically effective amt. of
     GLP-1 mol. is also claimed. The subject can also be administered free
     radical scavengers, glucose, or potassium. The GLP-1 compd. is
     administered by an infusion pump or by s.c. injection of a slow-release
     formulation.

A1

20010509

Individuals in need of treatment of ischemia-related reperfusion are AΒ treated, preferably i.v., with a compn. which includes a compd. which binds to a receptor for the glucagon-like peptide-1. The invention relates to both the method and compns. for such treatment.

- It has now been discovered that GLP-1 treatment after acute stroke or AB hemorrhage, preferably i.v. administration, can be an ideal treatment because it provides a means for optimizing insulin secretion, increasing brain anabolism, enhancing insulin effectiveness by suppressing glucagon, and maintaining euglycemia or mild hypoglycemia with no risk of severe hypoglycemia.

AΒ
     Individuals in need of treatment of ischemia-related reperfusion are
     treated, preferably i.v., with a compn. which includes a compd. which
     binds to a receptor for the glucagon-like peptide-1. The invention
     relates to both the method and compns. for such treatment.

     The present invention relates to a population of insulin producing cells
AΒ
     made by a process comprising contacting non-insulin producing cells with a
     growth factor selected from the group consisting of GLP-1 or Exendin-4,
     growth factors having amino acid sequences substantially homologous to
     GLP-1 or Exendin-4, and fragments thereof. The present invention also
     relates to methods of differentiating non-insulin producing cells into
     insulin producing cells and of enriching a population of cells for
     insulin-producing cells. The present invention also relates to methods of
     treating diabetes. Exendin-4 was more potent an insulinotropic agent than
     GLP-1 on several levels when given i.v.

     The present invention relates to derivs. exendin and of GLP-1(7-C),
```

AB The present invention relates to derivs. exendin and of GLP-1(7-C), wherein C is 35 or 36, which derivs. have just one lipophilic substituent which is attached to the C-terminal amino acid residue. The derivs. have a protracted action relative to GLP-1(7-37) and are useful for treating insulin-dependent and noninsulin-dependent diabetes mellitus. The derivs. of the invention can be combined with other antidiabetics or oral hypoglycemic agents. Pharmaceutical formulations contg. the derivs. of the invention are also claimed.

IT 165338-05-6DP, 1-31-Exendin 4 (Heloderma suspectum), lipophilic
derivs. 165338-06-7DP, lipophilic derivs.
RL: BAC (Biological activity or effector, except adverse); BSU (Biological
study, unclassified); SPN (Synthetic preparation); THU (Therapeutic use);
BIOL (Biological study); PREP (Preparation); USES (Uses)

(GLP-1 and exendin lipophilic derivs. with a protracted profile for treating diabetes mellitus and obesity)

    Exendin 4 is a biol. active peptide first isolated from Gila monster
AΒ
    venom. The invention encompasses polynucleotides encoding proexendin
    peptides, including exendin and novel peptides, as well as isolated or
    recombinant proexendin peptides. The invention also includes antibodies
    which specifically recognize such peptides.

    The invention concerns novel exendin analogs which can be used in the
    treatment of diabetes mellitus. The invention also concerns processes for
    prepg. these substances and medicaments contg. them. The exendin analogs
     are derived from HSDGTFTSDLSKQMEEEAVRLFIEWLKNGX1 or
    HGEGTFTSDLSKQMEEEAVRLFIEWLKNGX1, where X1 is a (non)proteogenic amino acid
    other than glycine. These analogs show better decompn. and metabolic
     stability and longer action than GLP-1 or exendin-3, resulting in fewer
    doses being administered.

- alpha.-Latrotoxin is a presynaptic neurotoxin isolated from the venom of AB the black widow spider Latrodectus tredecimguttatus. It exerts toxic effects in the vertebrate central nervous system by depolarizing neurons, by increasing [Ca2+]i and by stimulating uncontrolled exocytosis of neurotransmitters from nerve terminals. The actions of .alpha.-latrotoxin are mediated, in part, by a GTP-binding protein-coupled receptor referred to as CIRL or latrophilin. Exendin-4 is also a venom toxin, and it is derived from the salivary gland of the Gila monster Heloderma suspectum. It acts as an agonist at the receptor for glucagon-like peptide-1(7-36)-amide (GLP-I), thereby stimulating secretion of insulin from pancreatic .beta.-cells of the islets of Langerhans. Here is reported a surprising structural homol. between a-latrotoxin and exendin-4 that is also apparent amongst all members of the GLP-1-like family of secretagogic hormones (GLP-1, glucagon, vasoactive intestinal polypeptide, secretin, pituitary adenylyl cyclase activating polypeptide). On the basis of this homol., we report the synthesis and initial characterization of a chimeric peptide (Black Widow GLP-1) that stimulates Ca2+ signaling and insulin secretion in human .beta.-cells and MIN6 insulinoma cells. It is also reported here that the GTP-binding protein-coupled receptors for .alpha.-latrotoxin and exendin-4 share highly significant structural similarity in their extracellularly-oriented amino-termini. We propose that mol. mimicry has generated conserved structural motifs in secretagogic toxins and their receptors, thereby explaining the evolution of defense or predatory strategies that are shared in common amongst distantly related species including spiders, lizards, and snakes. Evidently, the toxic effects of .alpha.-latrotoxin and exendin-4 are explained by their ability to interact with GTP-binding protein-coupled receptors that normally mediate the actions of endogenous hormones or neuropeptides.

- Helodermin and exendin-4, two peptides isolated from the salivary gland of AB the Gila monster, Heloderma suspectum, are approx. 50% homologous to vasoactive intestinal peptide (VIP) and glucagon-like peptide-1 (GLP-1), resp., and interact with the mammalian receptors for VIP and GLP-1 with equal or higher affinity and efficacy. Immunohistochem. studies suggested the presence of helodermin-like peptides in mammals. To det. whether helodermin and exendin-4 are present in mammals and their evolutionary relationship to VIP and GLP-1, their cDNAs were first cloned from Gila monster salivary gland. Northern blots and reverse transcriptionpolymerase chain reaction of multiple Gila monster tissues identified .apprx.500-base pair transcripts only from salivary gland. Both helodermin and exendin-4 full-length cDNAs were .apprx.500 base pairs long, and they encoded precursor proteins contg. the entire amino acid sequence of helodermin and exendin-4, as well as a 44- or 45-amino acid N-terminal extension peptide, resp., having .apprx.60% homol. The size and structural organization of these cDNAs indicated that they are closely related to one another but markedly different from known cDNAs for the VIP/GLP-1 peptide family previously identified in both lower and higher evolved species. Cloning of the Gila monster VIP/peptide histidine isoleucine, pituitary adenylate cyclase activating polypeptide, and

glucagon/GLP-1 cDNAs and Southern blotting of Gila monster DNA demonstrate the coexistence of sep. genes for these peptides and suggests, along with the restricted salivary gland expression, that helodermin and exendin-4 coevolved to serve a sep. specialized function. Probing of a variety of rat and human tissues on Northern blots, human and rat Southern blots, and genomic and cDNA libraries with either helodermin- or exendin-4-specific cDNAs failed to identify evidence for mammalian homologs. These data indicate that helodermin and exendin-4 are not the precursors to VIP and GLP-1 and that they belong to a sep. peptide family encoded by sep. genes. Furthermore, the existence of as yet undiscovered mammalian homologs to helodermin and exendin-4 seems unlikely.

- Glucagon-like peptide-1 (7-36) amide (GLP-1), in addn. to its well known AB effect of enhancing glucose-mediated insulin release, has been shown to have insulinomimetic effects and to enhance insulin-mediated glucose uptake and lipid synthesis in 3T3-L1 adipocytes. To elucidate the mechanisms of GLP-1 action in these cells, the authors studied the signal transduction and peptide specificity of the GLP-1 response. In 3T3-L1 adipocytes, GLP-1 caused a decrease in intracellular cAMP levels which is the opposite to the response obsd. in pancreatic beta cells in response to the same peptide. In 3T3-L1 adipocytes, free intracellular calcium was not modified by GLP-1. Peptide specificity was examd. to help det. if a different GLP receptor isoform was expressed in 3T3-L1 adipocytes vs. beta cells. Peptides with partial homol. to GLP-1 such as GLP-2, GLP-1 (1-36), and glucagon all lowered cAMP levels in 3T3-L1 adipocytes. In addn., an antagonist of pancreatic GLP-1 receptor, exendin-4 (9-39), acted as an agonist to decrease cAMP levels in 3T3-L1 adipocytes as did exendin-4 (1-39), a known agonist for the pancreatic GLP-1 receptor. Binding studies using 125I-GLP-1 also suggest that pancreatic GLP-1 receptor isoform is not responsible for the effect of GLP-1 and related peptides in 3T3-L1 adipocytes. Based on these results, the authors propose that the major form of the GLP receptor in 3T3-L1 adipocytes is functionally different from the pancreatic GLP-1 receptor.

- AB GLP-1-(7-36)-amide and exendin-4-(1-39) are glucagon-like peptide-1 (GLP-1) receptor agonists, whereas exendin-(9-39) is the only known antagonist. To analyze the transition from agonist to antagonist and to

identify the amino acid residues involved in ligand activation of the GLP-1 receptor, we used exendin analogs with successive N-terminal truncations. Chinese hamster ovary cells stably transfected with the rat GLP-1 receptor were assayed for changes in intracellular cAMP caused by the test peptides in the absence or presence of half-maximal stimulatory doses of GLP-1. N-terminal truncation of a single amino acid reduced the agonist activity of the exendin peptide, whereas N-terminal truncation of 3-7 amino acids produced antagonists that were 4-10-fold more potent than exendin-(9-39). N-terminal truncation of GLP-1 by 2 amino acids resulted in weak agonist activity, but an 8-amino acid N-terminal truncation inactivated the peptide. Binding studies performed using 125I-labeled GLP-1 confirmed that all bioactive peptides specifically displaced tracer with high potency. In a set of exendin/GLP-1 chimeric peptides, substitution of GLP-1 sequences into exendin-(3-39) produced loss of antagonist activity with conversion to a weak agonist. The results show that receptor binding and activation occur in sep. domains of exendin, but they are more closely coupled in GLP-1.

- AΒ Glucagon-like peptide 1 stimulates insulin secretion and inhibits glucagon secretion, gastric emptying, and feeding, suggesting it may be biol. useful for the treatment of diabetes. A lizard glucagon-like peptide 1(GLP-1)-related peptide, exendin 4, binds to the GLP-1 receptor and mimics the actions of GLP-1 in vivo. To det. the genetic relationship between exendin 4 and GLP-1, the authors analyzed the structure and expression of pancreatic and intestinal proglucagon mRNAs in the reptile Heloderma suspectum. Two different proglucagon cDNAs (lizard proglucagon I (LPII) and lizard proglucagon II (LPII)), with unique 3'-untranslated regions were identified. Two LPI mRNA transcripts, .apprx.1.6 and 2.1 kilobases, encoded glucagon and GLP-1 but not GLP-2 and were restricted in expression to the pancreas. In contrast, a 1.1-kilobase LPII mRNA transcript, encoding glucagon, GLP-1, and GLP-2 utilized a different 3'-untranslated region and was expressed in both pancreas and intestine. Lizard proglucagon mRNA transcripts were not detectable by reverse transcription-polymerase chain reaction or Northern blotting in salivary gland. A single class of lizard salivary gland proexendin cDNAs encoded the sequence of exendin 4 and a 45-amino acid exendin N-terminal peptide. Exendin mRNA transcripts were expressed in the salivary gland, but not pancreas or intestine. These data demonstrate that GLP-1 and exendin 4 represent related yet distinct peptide encoded by different genes in the lizard.

- We synthesized and iodinated an exendin-4 analog, [Y39]exendin-4 (700 AΒ Ci/mmol), for use as a radioligand to characterize exendin receptors on dispersed pancreatic acini and qastric chief cells from guinea pig. Binding of this bioactive radioligand was rapid, temp.-dependent and specific (not inhibited by other pancreatic or gastric secretagogues). Measurement of the ability of exendin-4 to inhibit the binding of 125I-[Y39] exendin-4 indicated the presence of two classes of receptors. Pancreatic acini had 12.5 .times. 1010 binding sites/mg acinar protein of which 6% were high affinity (Kd = 0.5 nM) and 94% were low affinity (Kd = Chief cells had 3370 binding sites/cell of which 9% were high affinity (Kd = 0.3 nM) and 91% were low affinity (Kd = $0.2 \cdot \text{mu.M}$). Washing with 0.2 M acetic acid (pH 2.5), 0.2 M glycine (pH 10.5), or trypsin (100 .mu.q/mL) after 30 min incubation at 37.degree., indicated that 63 and 49% of radioligand was internalized in acini and chief cells, resp. Truncated glucagon-like peptide-1 (tGLP-1), a mammalian peptide sharing 53% homol. with exendin-4, inhibited radioligand binding at the same concns. that altered secretion from acini and chief cells. Glucagon, GLP-1 and GLP-2 inhibited 125I-[Y39]exendin-4 binding only at concns. .qtoreq.100 nM. Exendin(9-39)NH2, a specific exendin-receptor antagonist, potently inhibited 125I-[Y39] exendin-4 binding (IC50 = 6.1 and 3.5 nM in acini and chief cells, resp.). In pancreatic acini and gastric chief cells from guinea pig, exendin-3, exendin-4 and tGLP-1 increase cellular cAMP and modulate enzyme secretion by interacting with high-affinity exendin receptors. 125I-[Y39] exendin-4 is a useful radioligand for studying exendin receptors.

Exendin-4 purified from Heloderma suspectum venom shows structural , AB relationship to the important incretin hormone glucagon-like peptide 1-(7-36)-amide (GLP-1). The authors demonstrate that exendin-4 and truncated exendin-(9-39)-amide specifically interact with the GLP-1 receptor on insulinoma-derived cells and on lung membranes. Exendin-4 displaced 125I-GLP-1, and unlabeled GLP-1 displaced 125I-exendin-4 from the binding site at rat insulinoma-derived RINm5F cells. Exendin-4 had, like GLP-1, a pronounced effect on intracellular cAMP generation, which was reduced by exendin-(9-39)-amide. When combined, GLP-1 and exendin-4 showed additive action on cAMP. They each competed with the radiolabeled version of the other peptide in crosslinking expts. The apparent mol. mass of the resp. ligand-binding protein complex was 63,000 Da. Exendin-(9-39)-amide abolished the crosslinking of both peptides. Exendin-4, like GLP-1, stimulated dose dependently the glucose-induced insulin secretion in isolated rat islets, and, in mouse insulinoma .beta.TC-1 cells, both peptides stimulated the proinsulin gene expression at the level of transcription. Exendin-(9-39)-amide reduced these In conclusion, exendin-4 is an agonist and exendin-(9-39)-amide is a specific GLP-1 receptor antagonist.

- AΒ To find mammalian analogs of exendin-4, a peptide from Helodermatidae venoms that interacts with newly discovered exendin receptors on dispersed acini from quinea pig pancreas, the actions of glucagon-like peptide-1 [GLP-1(1-37)], its truncated form GLP-1(7-36)NH2, GLP-2(1-34), and pituitary adenylate cyclase-activating peptide were examd. and compared with secretin, VIP, and glucagon. Only the truncated form of glucagon-like peptide-1, GLP-1(7-36)NH2 mimicked the actions of exendin-4. Like exendin-4, GLP-1(7-36)NH2 increased acinar cAMP without stimulating amylase release. GLP-1(7-36)NH2-induced increases in cAMP were inhibited progressively by increasing concns. of the specific exendin-receptor antagonist, exendin(9-39)NH2. In dispersed acini from guinea pig and rat pancreas, concns. of GLP-1(7-36)NH2 that stimulated increases in cAMP caused potentiation of cholecystokinin-induced amylase release. Binding of 125I-[Y39]exendin-4 or 125I-GLP-1(7-36)NH2 to dispersed acini from quinea pig pancreas was inhibited by adding increasing concns. of unlabeled exendin-4 or GLP-1(7-36)NH2. Thus, the mammalian peptide GLP-1(7-36)NH2 interacts with exendin receptors on dispersed acini from quinea pig pancreas. Exendin(9-39)NH2, a competitive antagonist of the actions of GLP-1(7-36)NH2 in pancreatic acini, may be a useful tool for examg. the physiol. actions of this peptide.

- An amino acid sequencing assay for peptides contg. an amino-terminal AΒ histidine residue (His1) was used to isolate a 39-amino acid peptide, exendin-4, from H. suspectum venom. Exendin-4 differs from exendin-3 by two amino acid substitutions, Gly2-Glu3 in place of Ser2-Asp3, but is otherwise identical. The structural differences make exendin-4 distinct from exendin-3 in its bioactivity. In dispersed acini from guinea pig pancreas, natural and synthetic exendin-4 stimulate a monophasic increase in cAMP beginning at 100 pM that plateaus at 10 nM. The exendin-4-induced increase in cAMP is inhibited progressively by increasing concns. of the exendin receptor antagonist, exendin-(9-39) amide. Unlike exendin-3, exendin-4 does not stimulate a second rise in acinar cAMP at concns. >100 nM, does not stimulate amylase release, and does not inhibit the binding of radiolabeled vasoactive intestinal peptide to acini. This indicates that in dispersed pancreatic acini, exendin-4 interacts only with the recently described exendin receptor.

- LA English
- An assay for Hisl peptides performed by amino-terminal amino acid AΒ sequencing was used to screen venom from the Gila monster lizard, H. horridum. Two Hisl peptides were identified: helospectin and a new Hisl peptide that has been named exendin-3 to indicate that it is the third peptide to be found in an exocrine secretion of Heloderma lizards which has endocrine activity, the first two being helospectin (exendin-1) and helodermin (exendin-2). In the lot of H. horridum venom tested, exendin-3 was 5-10-fold more abundant in molar concn. than helospectin. The structure of exendin-3 was analyzed by amino acid sequencing and mass spectrometry. Exendin-3 is a 39-amino acid peptide with a mass of 4200. It contains a carboxyl-terminal amide and has a strong homol. with secretin at its amino-terminal 12 amino acids. The complete structure of exendin-3 is: His-Ser-Asp-Gly-Thr-Phe-Thr-Ser-Asp-Leu-Ser-Lys-Gln-Met-Glu-Glu-Glu-Ala-Val-Arg-Leu-Phe-Ile-Glu-Trp-Leu-Lys-Asn-Gly-Gly-Pro-Ser-Ser-Gly-Ala-Pro-Pro-Pro-Ser. It is 32 and 26% homologous with helospectin and helodermin, resp. It has greatest homol. with glucagon (48%) and human glucagon-like peptide-1 (50%). Exendin-3 (3 .mu.M) stimulated increases in cellular cAMP and amylase release from dispersed guinea pig pancreatic acini.

r IT 130357-25-4, Exendin 3 (Heloderma horridum)
RL: PRP (Properties)
 (amino acid sequence of)

AB WO 200041548 A UPAB: 20021120

NOVELTY - A new method for lowering plasma glucagon comprises administering a compound (C1) selected from exendin, an exendin agonist, a modified exendin or a modified exendin agonist.

ACTIVITY - Antidiabetic; dermatological.

MECHANISM OF ACTION - The compounds lower plasma glucagon level.

The safety, tolerability, and efficacy of synthetic exendin

-4 was evaluated in 8 male non-insulin using patients with type

2 diabetes who had discontinued other antidiabetic therapy for a minimum of 7 days. Each patient received subcutaneous (SC) injections of placebo (PBO) and 0.1, 0.2, and 0.3 micro g/kg exendin-4 48 hours apart in a single-blind, dose-rising, placebo controlled crossover design. Five patients also received a 0.4 micro g/kg dose. Plasma glucose, insulin and glucagon concentrations were assessed during fasting and in response to a 7 Kcal/kg Sustacal (RTM) challenge administered at the time of exendin-4/PBO injection. Gastric emptying was evaluated by measuring serum acetaminophen concentrations following a 20 mg/kg oral dose of liquid acetaminophen administered with the Sustacal (RTM).

No safety issues were identified based upon reported adverse events, EKG (undefined) and safety lab monitoring. Doses of 0.3 and 0.4 micro g/kg elicited a dose-dependent increase in nausea. Vomiting occurred at the highest dose.

Plasma glucose concentrations were reduced in all doses of exendin-4 compared to PBO although insulin concentrations were not significantly different. The 8 hour mean plus or minus SE changes in plasma glucose AUC (undefined) from baseline were +391 plus or minus 187, -263 plus or minus 108, -247 plus or minus 64, -336 plus or minus 139, and -328 plus or minus 70 (mg) (hr)/dL for the PBO, 0.1, 0.2, 0.3, and 0.4 micro g/kg doses respectively. The 3 hour changes in plasma glucagon were +128.0 plus or minus 19.2, -5.6 plus or minus 10.5, -29.4 plus or minus 18.6, -40.5 plus or minus 24.5, and +6.9 plus or minus 38.6 (pg) (hr)/mL respectively. The gastric emptying rate was slowed in all doses and the mean total absorbed acetaminophen over 6 hours was reduced by 51%, 50%, 57% and 79% compared to PBO for 0.1, 0.2, 0.3, and 0.4 micro g/kg doses respectively.

In summary, SC injection of **exendin-4** to patients identified no safety issues, was tolerated at doses at most 0.3 micro g/kg, reduced plasma glucose and **glucagon** and slowed the rate of gastric emptying.

USE - The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma (claimed). The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2 diabetes.

The DELETE command is used to remove various items stored by the system.

To delete a saved query, saved answer set, saved L-number list, SDI request, batch request, mailing list, or user-defined cluster, format, or search field, enter the name. The name may include? for left, right, or simultaneous left and right truncation.

Examples:

```
DELETE BIO?/O
                     - delete query names starting with BIO
DELETE ?DRUG/A
                     - delete answer set names ending with DRUG
                    - delete L-number lists containing ELEC
DELETE ?ELEC?/L
DELETE ANTICOAG/S
                     - delete SDI request
                    - delete batch request
DELETE ENZYME/B
DELETE .MYCLUSTER
                    - delete user-defined cluster
                     - delete user-defined display format
DELETE .MYFORMAT
DELETE .MYFIELD
                     - delete user-defined search field
DELETE NAMELIST MYLIST - delete mailing list
```

To delete an ordered document or an offline print, enter its number.

Examples:

```
DELETE P123001C - delete print request
DELETE D134002C - delete document order request
```

To delete an individual L-number or range of L-numbers, enter the L-number or L-number range. You may also enter DELETE LAST followed by a number, n, to delete the last n L-numbers. RENUMBER or NORENUMBER may also be explicitly specified to override the value of

SET RENUMBER.

Examples:

DELETE L21 - delete a single L-number

DELETE L3-L6 - delete a range of L-numbers

DELETE LAST 4 - delete the last 4 L-numbers

DELETE L33- - delete L33 and any higher L-number

DELETE L33- - delete L33 and any higher L-number

DELETE -L55 - delete L55 and any lower L-number

DELETE L2-L6 RENUMBER - delete a range of L-numbers and renumber remaining L-numbers

DELETE RENUMBER - renumber L-numbers after deletion of intermediate L-numbers

Entire sets of saved items, SDI requests, batch requests, user-defined items, or E-numbers can be deleted.

Examples:

DELETE SAVED/Q - delete all saved queries

DELETE SAVED/L - delete all saved answer sets

DELETE SAVED/L - delete all saved L-number lists

DELETE SAVED - delete all saved queries, answer sets, and L-number lists

DELETE SAVED/S - delete all SDI requests

DELETE SAVED/B - delete all batch requests

DELETE CLUSTER - delete all user-defined clusters

DELETE FORMAT - delete all user-defined search fields

DELETE FIELD - delete all user-defined search fields
DELETE SELECT - delete all E-numbers
DELETE HISTORY delete all I numbers and restart the

DELETE HISTORY - delete all L-numbers and restart the session at L1

To delete an entire multifile SDI request, enter DELETE and the name of the request. To delete a component from the multifile SDI, enter DELETE and the name of the component.

AU GREIG N H; EGAN J; DOYLE M; HOLLOWAY H; PERRY T A
TI New Glucagon-like peptide-1 or exendin-2 polypeptides, or their
analogues, useful for treating a subject with diabetes or a
neurodegenerative condition (e.g. Alzheimer's disease, stroke, multiple
sclerosis or brain injury);

recombinant glucagon-like protein preparation for disease therapy

AN 2003-12947 BIOTECHDS

AB DERWENT ABSTRACT:

NOVELTY - A purified polypeptide, which comprises the amino acid sequence of **Glucagon**-like peptide-1 (GLP-1), GLP-1 analogue, exendin-2 or an exendin analogue with a spacer between the amino acid residues comparable to residues 7 and 8, or residues 8 and 9 of GLP-1, is new. The

polypeptide comprises of any of 22 sequences having 28, 30, 33, 35, 37 or 39 amino acids fully defined in the specification.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following: (1) reducing neuronal death, promoting neuronal differentiation or proliferation, or promoting growth of neuronal processes, by contacting one or more neurons with the polypeptide; and (2) reducing formation or accumulation of amyloid protein by contacting one or more neurons with the polypeptide, which affects amyloid precursor protein metabolism.

BIOTECHNOLOGY - Preferred Polypeptide: The polypeptide is insulinotropic. The spacer is a 6-aminohexanoic acid spacer, which comprises less than four 6-aminohexanois acid residues. The polypeptide may further comprise any of 10 sequences having 30, 31, 39, 40, 43 or 46 amino acids fully defined in the specification. Preferred Method: The contacting cited in the methods of (2) is conducted in vivo or in vitro . Preparation: The peptides can be prepared using standard recombinant techniques.

ACTIVITY - Antidiabetic; Nootropic; Neuroprotective; Antiparkinsonian; Anticonvulsant; Cerebroprotective. Whole brain homogenates were assayed for amyloid-beta (Abeta) 1-40 levels following intracerebroventricular infusions of GLP-1, exendin-4, NGF or vehicle in normal control mice. After 48 hours, all animals were sacrificed, the brains removed and rapidly frozen in liquid nitrogen. Brains were pulverized and stored (-80degreesC) prior to assaying for Abeta levels. Equivalent volumes of conditioned media and whole brain homogenate were assayed for Abetal-40 using a sandwich ELISA. The monoclonal antibody BAN50 (raised against Abetal-16) was used as the capture antibody for species of Abeta (Abetal-20 and Abetal-42). All treatments reduced the levels of Abetal-40 compared to vehicle. Multiple comparisons following significant main effects of treatment demonstrated that Abetal-40 levels were reduced significantly following 6.6 mug GLP1 (36%, p less than 0.01) treatment.

MECHANISM OF ACTION - Insulinotropic; Insulin Agonist.

USE - The polypeptides are useful for treating a subject with diabetes (particularly type 2 diabetes) or a neurodegenerative condition (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, stroke, multiple sclerosis, brain injury, spinal cord injury or peripheral neuropathy), as well as for reducing the symptom(s) of neurodegenerative conditions in a subject. The polypeptide is also useful for reducing neuronal death (which is caused by a neurodegenerative condition, a toxin or an injury), promoting neuronal differentiation or proliferation, promoting growth of neuronal processes, reducing formation or accumulation of amyloid protein. The polypeptides are also useful for treating a subject with neurotoxic injury or neurodegenerative condition, or for reducing the symptom(s) of neurotoxic injury or neurodegenerative condition in a subject.

ADMINISTRATION - For in vivo use, the dosage is 0.1 pmoles/kg/minute to 100 nmoles/kg/minute for continuous administration; and 0.01-400 nmoles/kg for bolus injection. Administration is oral, intravenous, intramuscular, intraperitoneal, topical, transdermal, local, systemic, intraventricular, intracerebral, subdural or intrathecal.

EXAMPLE - The peptides were synthesized on a **PEG** -Polystyrene resin using Fmoc derivatives of amino acids. (119 pages)

TI Inducing stem cell differentiation by treating isolated stem cells with a retinoid such that portion of stem cells differentiate into hepaticopancreatic tissue such as pancreatic tissue, pancreatic endocrine tissue:

diabetic servere combined immmunodeficiency mouse animal model for disease therapy and tissue engineering

AN 2003-09339 BIOTECHDS

DERWENT ABSTRACT:

AB

NOVELTY - Inducing (M1) stem cell differentiation by treating isolated stem cells with a retinoid under conditions effective to cause at least a portion of the stem cells to differentiate into hepaticopancreatic tissue, is new.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for a composition (I) comprising the hepaticopancreatic tissue produced by (M1).

BIOTECHNOLOGY - Preferred Method: The stem cells are obtained from a stem cell source chosen from placenta, bone marrow, adipose tissue, neural tissue, umbilical cord, blastocyst inner cell mass, and germ cells. The retinoid is vitamin A, retinol, retinal, or retinoic acid, preferably retinoic acid. The conditions are effective to differentiate at least 1, preferably 5 % of the stem cells into hepaticopancreatic tissue. The method further involves treating the isolated stem cells with a morphogen such as a member of the glucagon-like peptide family, a cAMP raising agent, nicotinamide, a transcription factor, a protein growth factor, or their mixtures. Preferably, the morphogen is chosen from glucagon-like peptide (GLP)-1, exendin-4, PDX-1, Ngn-3, gastrin, gastrin-releasing peptide, hepatocyte growth factor, betacellulin, or their mixtures. Preferred Composition: (I) comprises hepaticopancreatic tissue which comprises glucose-responsive insulin-producing cells. (I) comprises 1 % or more of the hepaticopancreatic tissue produced by (M1). Preferably (I) comprises 10 % or more of the hepaticopancreatic tissue, and is obtained by purifying the hepaticopancreatic tissue produced by (M1).

ACTIVITY - Antidiabetic; Antiinflammatory; Hepatotropic; Cytostatic. Insulin-producing cells produced by differentiation of embryonic stem (ES) cells were cultured and were stained with the vital dye dithizone (DTZ). DTZ is a specific dye for zinc-containing granules that were especially abundant in differentiated beta-cells and were representative of insulin-containing storage structures. 200-300 DTZ positively stained cell clusters were transplanted under the kidney capsule of streptozotocin (STZ) induced diabetic serve combined immmunodeficient (SCID) mice to evaluate their ability to reverse the diabetic state of the animal. The results showed the ability of retinoic acid-treated differentiated embryonic stem cells to correct the blood glucose levels in STZ-SCID mice after transplantation.

MECHANISM OF ACTION - Cell therapy.

USE - (M1) is useful for inducing differentiation of stem cells (preferably mammalian embryonic stem cells) to hepaticopancreatic tissue such as pancreatic tissue; pancreatic endocrine tissue which comprises insulin-producing cells that are glucose-responsive; or liver tissue. (I) is useful for treating a mammal which involves identifying a mammal having an extraintestinal gastrointestinal disorder (a hepaticopancreatic disorder such as diabetes, pancreatitis, hepatic cirrhosis, hepatitis, cancer, and pancreatico-biliary disease) and administering (I) to the mammal. Preferably, (I) comprises glucose-responsive insulin-producing cells and is useful for treating diabetes in humans. (All claimed.)

ADMINISTRATION - (I) is preferably injected directly into the organ. No dosage is given.

EXAMPLE - Embryonic stem (ES) cell lines were cultured and spilt 1:8 every three days for 4 passages on gelatin coated tissue culture (TC) dishes without mouse embryonic fibroblasts (MEF's) (with 1500 units/ml lymphocyte inhibitory factor (LIF) in media) to remove MEF's from culture. The resulting stem cells were then differentiated as follows. On day 1, the stem cells were treated with trypsin to break up some aggregation and then suspended in 1 % fetal calf serum (FCS) media (without LIF). The stem cell were then allowed to self-aggregated into embryoid bodies in suspension culture. On day 3, the cells were given a fresh media change and then split among two bacterial petri dishes. A solution containing 1 micro-M retinoic acid was intermixed with the sample and both the control (no retinoic acid) and the sample were allowed to incubate at 37 degrees C. Fresh media were supplied at day 5 (with fresh 1 micro-M retinoic acid for the treated sample). At day 7 fresh media was supplied for both, with no retinoic acid (retinoic acid only present from days 3-7). Fresh media was supplied again on day 9. On day 11, the cells were again trypsinized and then placed into TC dishes with 10 % FCS media (no LIF). Small aliquots were taken at various times (days 14, 17, 19, 22 and 25) from the cultures and used for analysis by reverse transcriptase polymerase chain reaction (RT-PCR). On day 14, the media was changed for the two groups of cells, in each population (control and sample). On day 17, the media was changed again. On day 19, adherent cells were gently blown off, then trypsinized and resuspended in 10 % FCS in bacterial petri dish suspension cultures. On days 22 and 25, the remaining cells were collected, and a portion retained for RT-PCR analysis. All culturing from day 1 forward was performed in 25 millimolar (mM) glucose (high glucose) until after day 19, when it was changed to 5.5 mM glucose (lower glucose). Total RNA from each aliquot collected above was purified. The presence of specific RNA transcripts (i.e. insulin) was determined by RT-PCR. Total RNA was prepared from cultures of differentiating ES cells. RT-PCR analyses were performed. The RT-PCR results showed that no insulin was produced in any of the control samples, indicating an absence of insulin or amylase producing cells. In contrast, insulin-producing cells resulted when stem cells were treated with retinoic acid, as indicated by the presence of a correctly sized band during gel electrophoresis of insulin-specific RT-PCR generated products of RNA purified from aliquots obtained at days 14, 17, 19 and 22.(19 pages)

IN PRICKETT, K; YOUNG, A

TI Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.

AN 2000-672834 [65] WPIDS

AB WO 200066629 A UPAB: 20001214

NOVELTY - A modified exendin (I) or exendin agonist (II) comprising (I) or (II) linked to one or more polyethylene glycol (PEG) polymers, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (1) a method for making (I) or (II) comprising linking one or more PEG polymers to (I) and/or (II);
- (2) a method for treating a disease benefited by administration of(I) or (II);
- (3) a method of beneficially regulating gastrointestinal motility comprising administering (I) and/or (II);
- (4) a method for treatment of ingestion of a toxin comprising administering (I) or (II) to prevent or reduce the passage of stomach contents to the intestines and aspirating the contents of the stomach;
- (5) a method for reducing appetite or weight, lowering plasma lipids, treating diabetes mellitus, modulating triglyceride levels, or suppressing glucagon secretion comprising administering (I) and/or (II); and
 - (6) a pharmaceutical composition for use in the treatment of

conditions or disorders associated with hypernutrition, or in reducing the appetite or weight of a subject, or in suppressing glucagon secretion, or in modulating triglyceride levels comprising administering (I) and/or (II).

ACTIVITY - Anorectic; antidiabetic; hyperglycemic; hypoglycemic. No relevant biological data is given.

MECHANISM OF ACTION - Exendins modulate plasma glucose levels.

No relevant biological data is given.

USE - (I) and/or (II) are useful for treatment of diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake such as obesity and eating disorders. Dwg.0/6

TI Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

AN 2000-490999 [43] WPIDS

CR 2000-514584 [46]; 2001-514422 [56]

AB WO 200041548 A UPAB: 20021120

NOVELTY - A new method for lowering plasma glucagon comprises administering a compound (C1) selected from exendin, an exendin agonist, a modified exendin or a modified exendin agonist.

ACTIVITY - Antidiabetic; dermatological.

MECHANISM OF ACTION - The compounds lower plasma glucagon level.

The safety, tolerability, and efficacy of synthetic exendin -4 was evaluated in 8 male non-insulin using patients with type 2 diabetes who had discontinued other antidiabetic therapy for a minimum of 7 days. Each patient received subcutaneous (SC) injections of placebo (PBO) and 0.1, 0.2, and 0.3 micro g/kg exendin-4 48 hours apart in a single-blind, dose-rising, placebo controlled crossover design. Five patients also received a 0.4 micro g/kg dose. Plasma glucose, insulin and glucagon concentrations were assessed during fasting and in response to a 7 Kcal/kg Sustacal (RTM) challenge administered at the time of exendin-4/PBO injection. Gastric emptying was evaluated by measuring serum acetaminophen concentrations following a 20 mg/kg oral dose of liquid acetaminophen administered with the Sustacal (RTM).

No safety issues were identified based upon reported adverse events, EKG (undefined) and safety lab monitoring. Doses of 0.3 and 0.4 micro g/kg elicited a dose-dependent increase in nausea. Vomiting occurred at the highest dose.

Plasma glucose concentrations were reduced in all doses of exendin-4 compared to PBO although insulin concentrations were not significantly different. The 8 hour mean plus or minus SE changes in plasma glucose AUC (undefined) from baseline were +391 plus or minus 187, -263 plus or minus 108, -247 plus or minus 64, -336 plus or minus 139, and -328 plus or minus 70 (mg) (hr)/dL for the PBO, 0.1, 0.2, 0.3, and 0.4 micro g/kg doses respectively. The 3 hour changes in plasma glucagon were +128.0 plus or minus 19.2, -5.6 plus or minus 10.5, -29.4 plus or minus 18.6, -40.5 plus or minus 24.5, and +6.9 plus or minus 38.6 (pg) (hr)/mL respectively. The gastric emptying rate was slowed in all doses and the mean total absorbed acetaminophen over 6 hours was reduced by 51%, 50%, 57% and 79% compared to PBO for 0.1, 0.2, 0.3, and 0.4 micro g/kg doses respectively.

In summary, SC injection of **exendin-4** to patients identified no safety issues, was tolerated at doses at most 0.3 micro g/kg, reduced plasma glucose and **glucagon** and slowed the rate of gastric emptying.

USE - The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma (claimed). The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or

suppression of glucagon, e.g. type 1 and type 2 diabetes. Dwg.0/6

- New developments in the treatment of type 1 diabetes mellitus are reviewed. Insulin delivery, Pseudomassaria induced reversal of clinical signs of diabetes mellitus in mice, studies with insulin analogs (protracted- and fast-acting), glucagon-like peptides and blood glucose monitoring systems are discussed. (conference paper: International
- Symposium on Autoimmunity and Endocrinology, Frankfurt, Germany, 1999). ABEX Intrapulmonary insulin delivery has become feasible as a result of the development of high-efficacy nebulizers which provide a sufficient degree of intrapulmonary drug retention. This method of insulin administration has proved safe and efficient in clinical studies. P.o. insulin delivery seems feasible when surface active substances such as bile salts are used as resorption enhancers to cross the mucosal membrane in the gut. Use of zona occludens toxin (produced by Vibrio cholerae) has been reported. Protease inhibitors and polymer coatings have been used to protect the insulin molecule against digestive proteolytic activity. Pseudomassaria (L-783281) reverses the clinical signs of diabetes mellitus in mice by binding to the inner part of the insulin receptor and inducing typical insulin effects. Various insulin analogs have been designed and tested for clinical use including long-acting analogs such as HOE 901 and NN 304 and fast-acting lispro and insulin aspart (aimed at improving postprandial glucose regulation). Glucagon-like peptide-1 (GLP-1) improves metabolic control by a variety of effects but has a very short half-life. Derivatives with better resistance to degradation have been developed (exendin-4). Other approaches include the development of substances which augment endogenous release of GLP-1 and use of valine pyrrolidide to improve glucose tolerance. Various approaches aimed at improving or easing blood glucose self-monitoring have been developed. (E27/SK)

- Molecular cloning of the helodermin and exendin-4 cDNAs in the lizard: Relationship to vasoactive intestinal polypeptide/pituitary adenylate cyclase activating polypeptide and glucagon-like peptide 1 and evidence against the existence of mammalian homologues.
- AB Helodermin and exendin-4, two peptides isolated from the salivary gland of the Gila monster, Heloderma suspectum, are approximately 50% homologous to vasoactive intestinal peptide (VIP) and glucagon-like peptide-1 (GLP-1), respectively, and interact with the mammalian receptors for VIP and GLP-1 with equal or higher affinity and efficacy. Immunohistochemical studies suggested the presence of helodermin-like peptides in mammals. To determine whether helodermin and exendin-4 are present in mammals and their evolutionary relationship to VIP and GLP-1, their cDNAs were first cloned from Gila monster salivary gland. Northern blots and reverse transcription-polymerase chain reaction of multiple Gila monster tissues identified apprx500-base pair transcripts only from salivary gland. Both helodermin and exendin-4 full-length cDNAs were

apprx500 base pairs long, and they encoded precursor proteins containing the entire amino acid sequence of helodermin and exendin-4, as well as a 44- or 45-amino acid N-terminal extension peptide, respectively, having apprx60% homology. The size and structural organization of these cDNAs indicated that they were closely related to one another but markedly different from known cDNAs for the VIP/GLP-1 peptide family previously identified in both lower and higher evolved species. Cloning of the Gila monster VIP/peptide histidine isoleucine, pituitary adenylate cyclase activating polypeptide, and glucagon / GLP-1 cDNAs and Southern blotting of Gila monster DNA demonstrate the coexistence of separate genes for these peptides and suggests, along with the restricted salivary gland expression, that helodermin and exendin-4 coevolved to serve a separate specialized function. Probing of a variety of rat and human tissues on Northern blots, human and rat Southern blots, and genomic and cDNA libraries with either helodermin- or exendin-4-specific cDNAs failed to identify evidence for mammalian homologues. These data indicate that helodermin and exendin-4 are not the precursors to VIP and GLP-1 and that they belong to a separate peptide family encoded by separate genes. Furthermore, the existence of as yet undiscovered mammalian homologues to helodermin and exendin-4 seems unlikely.

- TI Tissue-specific expression of unique mRNAs that encode proglucagon-derived peptides or exendin 4 in the lizard.
- AB Glucagon-like peptide 1 stimulates insulin secretion and inhibits glucagon secretion, gastric emptying, and feeding, \cdot suggesting it may be biologically useful for the treatment of diabetes. A lizard glucagon-like peptide 1 (GLP-1)-related peptide, exendin 4, binds to the GLP-1 receptor and mimics the actions of GLP-1 in vivo. To determine the genetic relationship between exendin 4 and GLP-1, we analyzed the structure and expression of pancreatic and intestinal proglucagon mRNAs in the reptile Heloderma suspectum. Two different proglucagon cDNAs (lizard proglucagon I (LPI) and lizard proglucagon 11 (LPII)), with unique 3'-untranslated regions were identified. Two LPI mRNA transcripts, apprx 1.6 and 2.1 kilobases, encoded glucagon and GLP-1 but not GLP-2 and were restricted in expression to the pancreas. In contrast, a 1.1-kilobase LPII mRNA transcript, encoding glucagon, GLP-1, and GLP-2 utilized a different 3'-untranslated region and was expressed in both pancreas and intestine. Lizard proglucagon mRNA transcripts were not detectable by reverse transcription-polymerase chain reaction or Northern blotting in salivary gland. A single class of lizard salivary gland proexendin cDNAs encoded the sequence of exendin 4 and a 45-amino acid exendin NH-2-terminal peptide. Exendin mRNA transcripts were expressed in the salivary gland, but not pancreas or intestine. These data demonstrate that GLP-1 and exendin 4 represent related yet distinct peptides encoded by different genes in the lizard.

TI New Glucagon-like peptide-1 or exendin-2 polypeptides, or their analogues, useful for treating a subject with diabetes or a neurodegenerative condition (e.g. Alzheimer's disease, stroke, multiple sclerosis or brain injury);

recombinant glucagon-like protein preparation for disease therapy 2003-12947 BIOTECHDS

AB DERWENT ABSTRACT:

files.

AN

NOVELTY - A purified polypeptide, which comprises the amino acid sequence of **Glucagon**-like peptide-1 (GLP-1), GLP-1 analogue, exendin-2 or an exendin analogue with a spacer between the amino acid residues comparable to residues 7 and 8, or residues 8 and 9 of GLP-1, is new. The polypeptide comprises of any of 22 sequences having 28, 30, 33, 35, 37 or 39 amino acids fully defined in the specification.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following: (1) reducing neuronal death, promoting neuronal differentiation or proliferation, or promoting growth of neuronal processes, by contacting one or more neurons with the polypeptide; and (2) reducing formation or accumulation of amyloid protein by contacting one or more neurons with the polypeptide, which affects amyloid precursor protein metabolism.

BIOTECHNOLOGY - Preferred Polypeptide: The polypeptide is insulinotropic. The spacer is a 6-aminohexanoic acid spacer, which comprises less than four 6-aminohexanois acid residues. The polypeptide may further comprise any of 10 sequences having 30, 31, 39, 40, 43 or 46 amino acids fully defined in the specification. Preferred Method: The contacting cited in the methods of (2) is conducted in vivo or in vitro . Preparation: The peptides can be prepared using standard recombinant techniques.

ACTIVITY - Antidiabetic; Nootropic; Neuroprotective; Antiparkinsonian; Anticonvulsant; Cerebroprotective. Whole brain homogenates were assayed for amyloid-beta (Abeta) 1-40 levels following intracerebroventricular infusions of GLP-1, exendin-4, NGF or vehicle in normal control mice. After 48 hours, all animals were sacrificed, the brains removed and rapidly frozen in liquid nitrogen. Brains were pulverized and stored (-80degreesC) prior to assaying for Abeta levels. Equivalent volumes of conditioned media and whole brain homogenate were assayed for Abetal-40 using a sandwich ELISA. The monoclonal antibody BAN50 (raised against Abetal-16) was used as the capture antibody for species of Abeta (Abetal-20 and Abetal-42). All treatments reduced the levels of Abetal-40 compared to vehicle. Multiple comparisons following significant main effects of treatment demonstrated that Abetal-40 levels were reduced significantly following 6.6 mug GLP1 (36%, p less than 0.01) treatment.

MECHANISM OF ACTION - Insulinotropic; Insulin Agonist.

USE - The polypeptides are useful for treating a subject with diabetes (particularly type 2 diabetes) or a neurodegenerative condition (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, stroke, multiple sclerosis, brain injury, spinal cord injury or peripheral neuropathy), as well as for reducing the symptom(s) of neurodegenerative conditions in a subject. The polypeptide is also useful for reducing neuronal death (which is caused by a neurodegenerative condition, a toxin or an injury), promoting neuronal differentiation or proliferation, promoting growth of neuronal processes, reducing formation or accumulation of amyloid protein. The polypeptides are also useful for treating a subject with neurotoxic injury or

neurodegenerative condition, or for reducing the symptom(s) of neurotoxic injury or neurodegenerative condition in a subject.

ADMINISTRATION - For in vivo use, the dosage is 0.1 pmoles/kg/minute to 100 nmoles/kg/minute for continuous administration; and 0.01-400 nmoles/kg for bolus injection. Administration is oral, intravenous, intramuscular, intraperitoneal, topical, transdermal, local, systemic, intraventricular, intracerebral, subdural or intrathecal.

EXAMPLE - The peptides were synthesized on a **PEG** -Polystyrene resin using Fmoc derivatives of amino acids. (119 pages)

TI Inducing stem cell differentiation by treating isolated stem cells with a retinoid such that portion of stem cells differentiate into hepaticopancreatic tissue such as pancreatic tissue, pancreatic endocrine tissue;

diabetic servere combined immmunodeficiency mouse animal model for disease therapy and tissue engineering

AN 2003-09339 BIOTECHDS

AB DERWENT ABSTRACT:

NOVELTY - Inducing (M1) stem cell differentiation by treating isolated stem cells with a retinoid under conditions effective to cause at least a portion of the stem cells to differentiate into hepaticopancreatic tissue, is new.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for a composition (I) comprising the hepaticopancreatic tissue produced by (M1).

BIOTECHNOLOGY - Preferred Method: The stem cells are obtained from a stem cell source chosen from placenta, bone marrow, adipose tissue, neural tissue, umbilical cord, blastocyst inner cell mass, and germ cells. The retinoid is vitamin A, retinol, retinal, or retinoic acid, preferably retinoic acid. The conditions are effective to differentiate at least 1, preferably 5 % of the stem cells into hepaticopancreatic tissue. The method further involves treating the isolated stem cells with a morphogen such as a member of the glucagon-like peptide family, a cAMP raising agent, nicotinamide, a transcription factor, a protein growth factor, or their mixtures. Preferably, the morphogen is chosen from glucagon-like peptide (GLP)-1, exendin-4, PDX-1, Ngn-3, gastrin, gastrin-releasing peptide, hepatocyte growth factor, betacellulin, or their mixtures. Preferred Composition: (I) comprises hepaticopancreatic tissue which comprises glucose-responsive insulin-producing cells. (I) comprises 1 % or more of the hepaticopancreatic tissue produced by (M1). Preferably (I) comprises 10 % or more of the hepaticopancreatic tissue, and is obtained by purifying the hepaticopancreatic tissue produced by (M1).

ACTIVITY - Antidiabetic; Antiinflammatory; Hepatotropic; Cytostatic. Insulin-producing cells produced by differentiation of embryonic stem

(ES) cells were cultured and were stained with the vital dye dithizone (DTZ). DTZ is a specific dye for zinc-containing granules that were especially abundant in differentiated beta-cells and were representative of insulin-containing storage structures. 200-300 DTZ positively stained cell clusters were transplanted under the kidney capsule of streptozotocin (STZ) induced diabetic serve combined immmunodeficient (SCID) mice to evaluate their ability to reverse the diabetic state of the animal. The results showed the ability of retinoic acid-treated differentiated embryonic stem cells to correct the blood glucose levels in STZ-SCID mice after transplantation.

MECHANISM OF ACTION - Cell therapy.

USE - (M1) is useful for inducing differentiation of stem cells (preferably mammalian embryonic stem cells) to hepaticopancreatic tissue such as pancreatic tissue; pancreatic endocrine tissue which comprises insulin-producing cells that are glucose-responsive; or liver tissue. (I) is useful for treating a mammal which involves identifying a mammal having an extraintestinal gastrointestinal disorder (a hepaticopancreatic disorder such as diabetes, pancreatitis, hepatic cirrhosis, hepatitis, cancer, and pancreatico-biliary disease) and administering (I) to the mammal. Preferably, (I) comprises glucose-responsive insulin-producing cells and is useful for treating diabetes in humans. (All claimed.)

ADMINISTRATION - (I) is preferably injected directly into the organ. No dosage is given.

EXAMPLE - Embryonic stem (ES) cell lines were cultured and spilt 1:8 every three days for 4 passages on gelatin coated tissue culture (TC) dishes without mouse embryonic fibroblasts (MEF's) (with 1500 units/ml lymphocyte inhibitory factor (LIF) in media) to remove MEF's from culture. The resulting stem cells were then differentiated as follows. On day 1, the stem cells were treated with trypsin to break up some aggregation and then suspended in 1 % fetal calf serum (FCS) media (without LIF). The stem cell were then allowed to self-aggregated into embryoid bodies in suspension culture. On day 3, the cells were given a fresh media change and then split among two bacterial petri dishes. A solution containing 1 micro-M retinoic acid was intermixed with the sample and both the control (no retinoic acid) and the sample were allowed to incubate at 37 degrees C. Fresh media were supplied at day 5 (with fresh 1 micro-M retinoic acid for the treated sample). At day 7 fresh media was supplied for both, with no retinoic acid (retinoic acid only present from days 3-7). Fresh media was supplied again on day 9. On day 11, the cells were again trypsinized and then placed into TC dishes with 10 % FCS media (no LIF). Small aliquots were taken at various times (days 14, 17, 19, 22 and 25) from the cultures and used for analysis by reverse transcriptase polymerase chain reaction (RT-PCR). On day 14, the media was changed for the two groups of cells, in each population (control and sample). On day 17, the media was changed again. On day 19, adherent cells were gently blown off, then trypsinized and resuspended in 10 % FCS in bacterial petri dish suspension cultures. On days 22 and 25, the remaining cells were collected, and a portion retained for RT-PCR analysis. All culturing from day 1 forward was performed in 25 millimolar (mM) glucose (high glucose) until after day 19, when it was changed to 5.5 mM glucose (lower glucose). Total RNA from each aliquot collected above was purified. The presence of specific RNA transcripts (i.e. insulin) was determined by RT-PCR. Total RNA was prepared from cultures of differentiating ES cells. RT-PCR analyses were performed. The RT-PCR results showed that no insulin was produced in any of the control samples, indicating an absence of insulin or amylase producing cells. In contrast, insulin-producing cells resulted when stem cells were treated with retinoic acid, as indicated by the presence of a correctly sized band during gel electrophoresis of insulin-specific RT-PCR generated products of RNA purified from aliquots obtained at days 14, 17, 19 and 22.(19 pages)

ABEX Intrapulmonary insulin delivery has become feasible as a result of the development of high-efficacy nebulizers which provide a sufficient degree of intrapulmonary drug retention. This method of insulin administration has proved safe and efficient in clinical studies. P.o. insulin delivery seems feasible when surface active substances such as bile salts are used as resorption enhancers to cross the mucosal membrane in the gut. Use of zona occludens toxin (produced by Vibrio cholerae) has been reported. Protease inhibitors and polymer coatings have been used to protect the insulin molecule against digestive proteolytic activity. Pseudomassaria (L-783281) reverses the clinical signs of diabetes mellitus in mice by binding to the inner part of the insulin receptor and inducing typical insulin effects. Various insulin analogs have been designed and tested for clinical use including long-acting analogs such as HOE 901 and NN 304 and fast-acting lispro and insulin aspart (aimed at improving postprandial glucose regulation). Glucagon-like peptide-1 (GLP-1) improves metabolic control by a variety of effects but has a very short half-life. Derivatives with better resistance to degradation have been developed (exendin-4). Other approaches include the development of substances which augment endogenous release of GLP-1 and use of valine pyrrolidide to improve glucose tolerance. Various approaches aimed at improving or easing blood glucose self-monitoring have been developed. (E27/SK)

- TI Molecular cloning of the helodermin and exendin-4 cDNAs in the lizard: Relationship to vasoactive intestinal polypeptide/pituitary adenylate cyclase activating polypeptide and glucagon-like peptide 1 and evidence against the existence of mammalian homologues.
- Helodermin and exendin-4, two peptides isolated from AB the salivary gland of the Gila monster, Heloderma suspectum, are approximately 50% homologous to vasoactive intestinal peptide (VIP) and glucagon-like peptide-1 (GLP-1), respectively, and interact with the mammalian receptors for VIP and GLP-1 with equal or higher affinity and efficacy. Immunohistochemical studies suggested the presence of helodermin-like peptides in mammals. To determine whether helodermin and exendin-4 are present in mammals and their evolutionary relationship to VIP and GLP-1, their cDNAs were first cloned from Gila monster salivary gland. Northern blots and reverse transcriptionpolymerase chain reaction of multiple Gila monster tissues identified apprx500-base pair transcripts only from salivary gland. Both helodermin and exendin-4 full-length cDNAs were apprx500 base pairs long, and they encoded precursor proteins containing the entire amino acid sequence of helodermin and exendin-4, as well as a 44- or 45-amino acid N-terminal extension peptide, respectively, having apprx60% homology. The size and structural organization of these cDNAs indicated that they were closely related to one another but markedly different from known cDNAs for the VIP/GLP-1 peptide family previously identified in both lower and higher evolved species. Cloning of the Gila monster VIP/peptide histidine isoleucine, pituitary adenylate cyclase activating polypeptide, and glucagon / GLP-1 cDNAs and Southern blotting of Gila monster DNA demonstrate the coexistence of separate genes for these peptides and suggests, along with the restricted salivary gland expression, that helodermin and exendin-4 coevolved to serve a separate specialized function. Probing of a variety of rat and human tissues on Northern blots, human and rat Southern blots, and genomic and cDNA libraries with either helodermin- or exendin-4-specific cDNAs failed to identify evidence for mammalian homologues. These data indicate that helodermin and exendin-4 are not the precursors to VIP and GLP-1 and that they belong to a separate peptide family encoded by separate genes. Furthermore, the existence of as yet undiscovered mammalian homologues to helodermin and exendin-4 seems unlikely.
- L249 ANSWER 8 OF 9 BIOSIS COPYRIGHT 2003 BIOLOGICAL ABSTRACTS INC.DUPLICATE 2 SO Journal of Biological Chemistry, (1997) Vol. 272, No. 7, pp. 4108-4115. ISSN: 0021-9258.
- AU Chen, Yuqing E.; Drucker, Daniel J. (1)
- TI Tissue-specific expression of unique mRNAs that encode proglucagon-derived peptides or exendin 4 in the lizard.
- AB Glucagon-like peptide 1 stimulates insulin secretion and inhibits glucagon secretion, gastric emptying, and feeding, suggesting it may be biologically useful for the treatment of diabetes. A lizard glucagon-like peptide 1 (GLP-1)-related peptide, exendin 4, binds to the GLP-1 receptor and mimics the actions of GLP-1 in vivo. To determine the genetic relationship between exendin 4 and GLP-1, we analyzed the structure and expression of pancreatic and intestinal proglucagon mRNAs in the reptile Heloderma suspectum. Two different proglucagon cDNAs (lizard proglucagon I (LPI) and lizard proglucagon 11 (LPII)), with unique 3'-untranslated regions were identified. Two LPI mRNA transcripts, apprx 1.6 and 2.1 kilobases, encoded glucagon and GLP-1 but not GLP-2 and were restricted in expression to the pancreas. In contrast, a 1.1-kilobase LPII mRNA transcript, encoding glucagon, GLP-1, and GLP-2 utilized a different 3'-untranslated region and was expressed in both pancreas and

intestine. Lizard proglucagon mRNA transcripts were not detectable by reverse transcription-polymerase chain reaction or Northern blotting in salivary gland. A single class of lizard salivary gland proexendin cDNAs encoded the sequence of exendin 4 and a 45-amino acid exendin NH-2-terminal peptide. Exendin mRNA transcripts were expressed in the salivary gland, but not pancreas or intestine. These data demonstrate that GLP-1 and exendin 4 represent related yet distinct peptides encoded by different genes in the lizard.

AB DERWENT ABSTRACT:

ΑU

NOVELTY - A purified polypeptide, which comprises the amino acid sequence of Glucagon-like peptide-1 (GLP-1), GLP-1 analogue, exendin-2 or an exendin analogue with a spacer between the amino acid residues comparable to residues 7 and 8, or residues 8 and 9 of GLP-1, is new. The polypeptide comprises of any of 22 sequences having 28, 30, 33, 35, 37 or 39 amino acids fully defined in the specification.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following: (1) reducing neuronal death, promoting neuronal differentiation or proliferation, or promoting growth of neuronal processes, by contacting one or more neurons with the polypeptide; and (2) reducing formation or accumulation of amyloid protein by contacting one or more neurons with the polypeptide, which affects amyloid precursor protein metabolism.

BIOTECHNOLOGY - Preferred Polypeptide: The polypeptide is insulinotropic. The spacer is a 6-aminohexanoic acid spacer, which comprises less than four 6-aminohexanois acid residues. The polypeptide may further comprise any of 10 sequences having 30, 31, 39, 40, 43 or 46 amino acids fully defined in the specification. Preferred Method: The contacting cited in the methods of (2) is conducted in vivo or in vitro . Preparation: The peptides can be prepared using standard recombinant techniques.

ACTIVITY - Antidiabetic; Nootropic; Neuroprotective; Antiparkinsonian; Anticonvulsant; Cerebroprotective. Whole brain homogenates were assayed for amyloid-beta (Abeta) 1-40 levels following intracerebroventricular infusions of GLP-1, exendin-4, NGF or vehicle in normal control mice. After 48 hours, all animals were sacrificed, the brains removed and rapidly frozen in liquid nitrogen. Brains were pulverized and stored (-80degreesC) prior to assaying for Abeta levels. Equivalent volumes of conditioned media and whole brain homogenate were assayed for Abetal-40 using a sandwich ELISA. The monoclonal antibody BAN50 (raised against Abetal-16) was used as the capture antibody for species of Abeta (Abetal-20 and Abetal-42). All treatments reduced the levels of Abetal-40 compared to vehicle. Multiple comparisons following significant main effects of treatment demonstrated that Abetal-40 levels were reduced significantly following 6.6 mug GLP1 (36%, p less than 0.01) treatment.

MECHANISM OF ACTION - Insulinotropic; Insulin Agonist.

USE - The polypeptides are useful for treating a subject with diabetes (particularly type 2 diabetes) or a neurodegenerative condition (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, stroke, multiple sclerosis, brain injury,

spinal cord injury or peripheral neuropathy), as well as for reducing the symptom(s) of neurodegenerative conditions in a subject. The polypeptide is also useful for reducing neuronal death (which is caused by a neurodegenerative condition, a toxin or an injury), promoting neuronal differentiation or proliferation, promoting growth of neuronal processes, reducing formation or accumulation of amyloid protein. The polypeptides are also useful for treating a subject with neurotoxic injury or neurodegenerative condition, or for reducing the symptom(s) of neurotoxic injury or neurodegenerative condition in a subject.

ADMINISTRATION - For in vivo use, the dosage is 0.1 pmoles/kg/minute to 100 nmoles/kg/minute for continuous administration; and 0.01-400 nmoles/kg for bolus injection. Administration is oral, intravenous, intramuscular, intraperitoneal, topical, transdermal, local, systemic, intraventricular, intracerebral, subdural or intrathecal.

EXAMPLE - The peptides were synthesized on a PEG

-Polystyrene resin using Fmoc derivatives of amino acids. (119 pages)

TT Inducing stem cell differentiation by treating isolated stem cells with a retinoid such that portion of stem cells differentiate into hepaticopancreatic tissue such as pancreatic tissue, pancreatic endocrine

tissue; diabetic servere combined immmunodeficiency mouse animal model for disease therapy and tissue engineering

AU SHERIDAN S D

AN

AB

2003-09339 BIOTECHDS

DERWENT ABSTRACT:

NOVELTY - Inducing (M1) stem cell differentiation by treating isolated stem cells with a retinoid under conditions effective to cause at least a portion of the stem cells to differentiate into hepaticopancreatic tissue, is new.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for a composition (I) comprising the hepaticopancreatic tissue produced by (M1)

BIOTECHNOLOGY - Preferred Method: The stem cells are obtained from a stem cell source chosen from placenta, bone marrow, adipose tissue, neural tissue, umbilical cord, blastocyst inner cell mass, and germ cells. The retinoid is vitamin A, retinol, retinal, or retinoic acid, preferably retinoic acid. The conditions are effective to differentiate at least 1, preferably 5 % of the stem cells into hepaticopancreatic tissue. The method further involves treating the isolated stem cells with a morphogen such as a member of the glucagon-like peptide family, a cAMP raising agent, nicotinamide, a transcription factor, a protein growth factor, or their mixtures. Preferably, the morphogen is chosen from qlucagon-like peptide (GLP)-1, exendin-4, PDX-1, Ngn-3, gastrin, gastrin-releasing peptide, hepatocyte growth factor, betacellulin, or their mixtures. Preferred Composition: (I) comprises hepaticopancreatic tissue which comprises glucose-responsive insulin-producing cells. (I) comprises 1 % or more of the hepaticopancreatic tissue produced by (M1). Preferably (I) comprises 10 % or more of the hepaticopancreatic tissue, and is obtained by purifying the hepaticopancreatic tissue produced by (M1).

ACTIVITY - Antidiabetic; Antiinflammatory; Hepatotropic; Cytostatic. Insulin-producing cells produced by differentiation of embryonic stem (ES) cells were cultured and were stained with the vital dye dithizone (DTZ). DTZ is a specific dye for zinc-containing granules that were especially abundant in differentiated beta-cells and were representative of insulin-containing storage structures. 200-300 DTZ positively stained cell clusters were transplanted under the kidney capsule of streptozotocin (STZ) induced diabetic serve combined immmunodeficient (SCID) mice to evaluate their ability to reverse the diabetic state of the animal. The results showed the ability of retinoic acid-treated differentiated embryonic stem cells to correct the blood glucose levels in STZ-SCID mice after transplantation.

MECHANISM OF ACTION - Cell therapy.

USE - (M1) is useful for inducing differentiation of stem cells (preferably mammalian embryonic stem cells) to hepaticopancreatic tissue such as pancreatic tissue; pancreatic endocrine tissue which comprises insulin-producing cells that are glucose-responsive; or liver tissue. (I) is useful for treating a mammal which involves identifying a mammal having an extraintestinal gastrointestinal disorder (a hepaticopancreatic disorder such as diabetes, pancreatitis, hepatic cirrhosis, hepatitis, cancer, and pancreatico-biliary disease) and administering (I) to the mammal. Preferably, (I) comprises glucose-responsive insulin-producing cells and is useful for treating diabetes in humans. (All claimed.)

ADMINISTRATION - (I) is preferably injected directly into the organ. No dosage is given.

EXAMPLE - Embryonic stem (ES) cell lines were cultured and spilt 1:8 every three days for 4 passages on gelatin coated tissue culture (TC) dishes without mouse embryonic fibroblasts (MEF's) (with 1500 units/ml lymphocyte inhibitory factor (LIF) in media) to remove MEF's from culture. The resulting stem cells were then differentiated as follows. On day 1, the stem cells were treated with trypsin to break up some aggregation and then suspended in 1 % fetal calf serum (FCS) media (without LIF). The stem cell were then allowed to self-aggregated into embryoid bodies in suspension culture. On day 3, the cells were given a fresh media change and then split among two bacterial petri dishes. A solution containing 1 micro-M retinoic acid was intermixed with the sample and both the control (no retinoic acid) and the sample were

allowed to incubate at 37 degrees C. Fresh media were supplied at day 5 (with fresh 1 micro-M retinoic acid for the treated sample). At day 7 fresh media was supplied for both, with no retinoic acid (retinoic acid only present from days 3-7). Fresh media was supplied again on day 9. On day 11, the cells were again trypsinized and then placed into TC dishes with 10 % FCS media (no LIF). Small aliquots were taken at various times (days 14, 17, 19, 22 and 25) from the cultures and used for analysis by reverse transcriptase polymerase chain reaction (RT-PCR). On day 14, the media was changed for the two groups of cells, in each population (control and sample). On day 17, the media was changed again. On day 19, adherent cells were gently blown off, then trypsinized and resuspended in 10 % FCS in bacterial petri dish suspension cultures. On days 22 and 25, the remaining cells were collected, and a portion retained for RT-PCR analysis. All culturing from day 1 forward was performed in 25 millimolar (mM) glucose (high glucose) until after day 19, when it was changed to 5.5 mM glucose (lower glucose). Total RNA from each aliquot collected above was purified. The presence of specific RNA transcripts (i.e. insulin) was determined by RT-PCR. Total RNA was prepared from cultures of differentiating ES cells. RT-PCR analyses were performed. The RT-PCR results showed that no insulin was produced in any of the control samples, indicating an absence of insulin or amylase producing cells. In contrast, insulin-producing cells resulted when stem cells were treated with retinoic acid, as indicated by the presence of a correctly sized band during gel electrophoresis of insulin-specific RT-PCR generated products of RNA purified from aliquots obtained at days 14, 17, 19 and 22. > NOVELTY - A modified exendin (I) or exendin agonist (II) comprising (I) or (II) linked to one or more polyethylene glycol (PEG) polymers, is new. DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (1) a method for making (I) or (II) comprising linking one or more PEG polymers to (I) and/or (II);
- (2) a method for treating a disease benefited by administration of (I) or (II);
- (3) a method of beneficially regulating gastrointestinal motility comprising administering (I) and/or (II);
- (4) a method for treatment of ingestion of a toxin comprising administering (I) or (II) to prevent or reduce the passage of stomach contents to the intestines and aspirating the contents of the stomach;
- (5) a method for reducing appetite or weight, lowering plasma lipids, treating diabetes mellitus, modulating triglyceride levels, or suppressing glucagon secretion comprising administering (I) and/or (II); and

(6) a pharmaceutical composition for use in the treatment of conditions or disorders associated with hypernutrition, or in reducing the appetite or weight of a subject, or in suppressing glucagon secretion, or in modulating triglyceride levels comprising administering (I) and/or (II).

ACTIVITY - Anorectic; antidiabetic; hyperglycemic; hypoglycemic. No relevant biological data is given.

MECHANISM OF ACTION - Exendins modulate plasma glucose levels. No relevant biological data is given.

USE - (I) and/or (II) are useful for treatment of diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake such as obesity and eating disorders.

L249 ANSWER 5 OF 9 WPIDS (C) 2003 THOMSON DERWENT

TI Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

IN GEDULIN, B; YOUNG, A

AN 2000-490999 [43] WPIDS

CR 2000-514584 [46]; 2001-514422 [56]

AB WO 200041548 A UPAB: 20021120

NOVELTY - A new method for lowering plasma glucagon comprises administering a compound (C1) selected from exendin, an exendin agonist, a modified exendin or a modified exendin agonist.

ACTIVITY - Antidiabetic; dermatological.

MECHANISM OF ACTION - The compounds lower plasma glucagon level.

The safety, tolerability, and efficacy of synthetic exendin -4 was evaluated in 8 male non-insulin using patients with type 2 diabetes who had discontinued other antidiabetic therapy for a minimum of 7 days. Each patient received subcutaneous (SC) injections of placebo (PBO) and 0.1, 0.2, and 0.3 micro g/kg exendin-4 48 hours apart in a single-blind, dose-rising, placebo controlled crossover design. Five patients also received a 0.4 micro g/kg dose. Plasma glucose, insulin and glucagon concentrations were assessed during fasting and in response to a 7 Kcal/kg Sustacal (RTM) challenge administered at the time of exendin-4/PBO injection. Gastric emptying was evaluated by measuring serum acetaminophen concentrations following a 20 mg/kg oral dose of liquid acetaminophen administered with the Sustacal (PTM)

No safety issues were identified based upon reported adverse events, EKG (undefined) and safety lab monitoring. Doses of 0.3 and 0.4 micro g/kg elicited a dose-dependent increase in nausea. Vomiting occurred at the highest dose.

Plasma glucose concentrations were reduced in all doses of exendin-4 compared to PBO although insulin concentrations were not significantly different. The 8 hour mean plus or minus SE changes in plasma glucose AUC (undefined) from baseline were +391 plus or minus 187, -263 plus or minus 108, -247 plus or minus 64, -336 plus or minus 139, and -328 plus or minus 70 (mg) (hr)/dL for the PBO, 0.1, 0.2, 0.3, and 0.4 micro g/kg doses respectively. The 3 hour changes in plasma glucagon were +128.0 plus or minus 19.2, -5.6 plus or minus 10.5, -29.4 plus or minus 18.6, -40.5 plus or minus 24.5, and +6.9 plus or minus 38.6 (pg) (hr)/mL respectively. The gastric emptying rate was slowed in all doses and the mean total absorbed acetaminophen over 6 hours was reduced by 51%, 50%, 57% and 79% compared to PBO for 0.1, 0.2, 0.3, and 0.4 micro g/kg doses respectively.

In summary, SC injection of **exendin-4** to patients identified no safety issues, was tolerated at doses at most 0.3 micro g/kg, reduced plasma glucose and **glucagon** and slowed the rate of gastric emptying.

USE - The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma (claimed). The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2 diabetes. Dwg.0/6

Diabetes-Schulungszentrum, Medizinische Klinik I, Klinikum der Johann ΑV Wolfgang Goethe-Universitaet, Theodor-Stern-Kai 7, D- 60590 Frankfurt am Main, Germany. (e-mail: DSZ-Haak@em.uni- frankfurt.de).

TI New developments in the treatment of type 1 diabetes mellitus.

ΑU Haak AN 1999-43452 DRUGU T E

New developments in the treatment of type 1 diabetes mellitus are reviewed. Insulin delivery, Pseudomassaria induced reversal of clinical signs of diabetes mellitus in mice, studies with insulin analogs (protracted- and fast-acting), glucagon-like peptides and blood glucose monitoring systems are discussed. (conference paper: International Symposium on Autoimmunity and Endocrinology, Frankfurt, Germany, 1999).

Intrapulmonary insulin delivery has become feasible as a result of the ABEX development of high-efficacy nebulizers which provide a sufficient degree of intrapulmonary drug retention. This method of insulin administration has proved safe and efficient in clinical studies. P.o. insulin delivery seems feasible when surface active substances such as bile salts are used as resorption enhancers to cross the mucosal membrane in the gut. Use of zona occludens toxin (produced by Vibrio cholerae) has been reported. Protease inhibitors and polymer coatings have been used to protect the insulin molecule against digestive proteolytic activity. Pseudomassaria (L-783281) reverses the clinical signs of diabetes mellitus in mice by binding to the inner part of the insulin receptor and inducing typical insulin effects. Various insulin analogs have been designed and tested for clinical use including long-acting analogs such as HOE 901 and NN 304 and fast-acting lispro and insulin aspart (aimed at improving postprandial glucose regulation). Glucagon-like peptide-1 (GLP-1) improves metabolic control by a variety of effects but has a very short half-life. Derivatives with better resistance to degradation have been developed (exendin-4). Other approaches include the development of substances which augment endogenous release of GLP-1 and use of valine pyrrolidide to improve glucose tolerance. Various approaches aimed at improving or easing blood glucose self-monitoring have been developed. (E27/SK)

TI Molecular cloning of the helodermin and exendin-4 cDNAs in the lizard: Relationship to vasoactive intestinal polypeptide/pituitary adenylate cyclase activating polypeptide and glucagon-like peptide 1 and evidence against the existence of mammalian homologues.

AU Pohl, Markus; Wank, Stephen A. (1)

AB Helodermin and exendin-4, two peptides isolated from the salivary gland of the Gila monster, Heloderma suspectum, are approximately 50% homologous to vasoactive intestinal peptide (VIP) and glucagon-like peptide-1 (GLP-1), respectively, and interact with the mammalian receptors for VIP and GLP-1 with equal or higher affinity and efficacy. Immunohistochemical studies suggested the presence of helodermin-like peptides in mammals. To determine whether helodermin and exendin-4 are present in mammals and their evolutionary

relationship to VIP and GLP-1, their cDNAs were first cloned from Gila monster salivary gland. Northern blots and reverse transcriptionpolymerase chain reaction of multiple Gila monster tissues identified apprx500-base pair transcripts only from salivary gland. Both helodermin and exendin-4 full-length cDNAs were apprx500 base pairs long, and they encoded precursor proteins containing the entire amino acid sequence of helodermin and exendin-4, as well as a 44- or 45-amino acid N-terminal extension peptide, respectively, having apprx60% homology. The size and structural organization of these cDNAs indicated that they were closely related to one another but markedly different from known cDNAs for the VIP/GLP-1 peptide family previously identified in both lower and higher evolved species. Cloning of the Gila monster VIP/peptide histidine isoleucine, pituitary adenylate cyclase activating polypeptide, and glucagon / GLP-1 cDNAs and Southern blotting of Gila monster DNA demonstrate the coexistence of separate genes for these peptides and suggests, along with the restricted salivary gland expression, that helodermin and exendin-4 coevolved to serve a separate specialized function. Probing of a variety of rat and human tissues on Northern blots, human and rat Southern blots, and genomic and cDNA libraries with either helodermin- or exendin-4-specific cDNAs failed to identify evidence for mammalian homologues. These data indicate that helodermin and exendin-4 are not the precursors to VIP and GLP-1 and that they belong to a separate peptide family encoded by separate genes. Furthermore, the existence of as yet undiscovered mammalian homologues to helodermin and exendin-4 seems unlikely.

TI Tissue-specific expression of unique mRNAs that encode proglucagon-derived peptides or exendin 4 in the lizard.

AU Chen, Yuqing E.; Drucker, Daniel J. (1)

Glucagon-like peptide 1 stimulates insulin secretion and AB inhibits glucagon secretion, gastric emptying, and feeding, suggesting it may be biologically useful for the treatment of diabetes. A lizard glucagon-like peptide 1 (GLP-1)-related peptide, exendin 4, binds to the GLP-1 receptor and mimics the actions of GLP-1 in vivo. To determine the genetic relationship between exendin 4 and GLP-1, we analyzed the structure and expression of pancreatic and intestinal proglucagon mRNAs in the reptile Heloderma suspectum. Two different proglucagon cDNAs (lizard proglucagon I (LPI) and lizard proglucagon 11 (LPII)), with unique 3'-untranslated regions were identified. Two LPI mRNA transcripts, apprx 1.6 and 2.1 kilobases, encoded glucagon and GLP-1 but not GLP-2 and were restricted in expression to the pancreas. In contrast, a 1.1-kilobase LPII mRNA transcript, encoding glucagon, GLP-1, and GLP-2 utilized a different 3'-untranslated region and was expressed in both pancreas and

intestine. Lizard proglucagon mRNA transcripts were not detectable by reverse transcription-polymerase chain reaction or Northern blotting in salivary gland. A single class of lizard salivary gland proexendin cDNAs encoded the sequence of exendin 4 and a 45-amino acid exendin NH-2-terminal peptide. Exendin mRNA transcripts were expressed in the salivary gland, but not pancreas or intestine. These data demonstrate that GLP-1 and exendin 4 represent

related yet distinct peptides encoded by different genes in the lizard.

The invention provides methods of treating prophylactically an individual in whom Type 2 diabetes mellitus has not yet presented, but in whom there is an increased risk of developing such condition, which methods comprise administering to an individual in need thereof an effective amount of a glycogen phosphorylase inhibitor; effective amounts of a glycogen phosphorylase inhibitor and a non-glycogen phosphorylase inhibiting anti-diabetic agent; or effective amounts of a glycogen phosphorylase inhibitor and an anti-obesity agent.

The invention further provides methods of treating prophylactically an individual in whom Type 2 diabetes mellitus has not yet presented, but in whom there is an increased risk of developing such condition, which methods comprise administering to an individual in need thereof a pharmaceutical composition comprising effective amounts of a glycogen phosphorylase inhibitor and a non-glycogen phosphorylase inhibiting anti-diabetic agent; or effective amounts of a glycogen phosphorylase inhibitor and an anti-obesity agent.

AB Novel compounds, which act to antagonize the action of the glucagon hormone on the glucagon receptor. Owing to their antagonizing effect of the glucagon receptor the compounds may be suitable for the treatment and/or prevention of any diseases and disorders, wherein a glucagon antagonistic action is beneficial, such as hyperglycemia, Type 1 diabetes, Type 2 diabetes, disorders of the lipid metabolism and obesity.

> NOVELTY - A glycogen phosphorylase inhibitor (G1) is used in the manufacture of a medicament for prophylactically treating an individual with increased risk of developing Type II diabetes mellitus

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (1) a pharmaceutical composition comprising (G1) and a non-glycogen phosphorylase inhibiting anti-diabetic agent (NG1); and
- (2) a pharmaceutical composition comprising (G1) and an anti-obesity agent.

ACTIVITY - Antidiabetic.

MECHANISM OF ACTION - Glycogen phosphorylase inhibitor.

No biological data is given.

USE - For prophylactically treating a person having risk associated with Type 2 diabetes (particularly risk associated with insulin resistance and/or hyperinsulinemia; environmental or genetic Type 2 diabetes

predisposing disease states or conditions (e.g. person with a family history of diabetes); race and/or ethnicity (e.g. individuals from African-American, Hispanic, Native American, Asian, or Pacific Islander population); genetic mutations affecting beta -cell function (e.g. defect on chromosome 12, gene HNF-1 alpha (MODY3), chromosome 7, gene glucokinase (MODY2), chromosome 20, gene HNF-4a (MODY1), or mitochondrial DNA); genetic defects in insulin action (e.g. genetic mutation leading to Type A insulin resistance, acanthosis nigricans, leprechaunism, Rabson-Mendenhall syndrome, lipoatrophic diabetes, or a genetic mutation or mutations in the insulin receptor, IRS proteins, glucose transporters, PC-1, glucokinase, UCP-1, beta 3 adrenergic receptor gene); presence of excess adipose tissue or clinically diagnosed obesity (e.g. central obesity); clinical chemistry or diagnostic testing signifying a pre-diabetic state (e.g. impaired glucose tolerance, impaired fasting glucose, or hyperglycemia relative to normoglycemia); physiologic and endocrine changes associated with growth, development, or aging (e.g. menopausal, pubescent, or aged individuals); diet or eating behaviors (e.g consumption of high fat or high carbohydrate diets, experiencing prolonged fasting or starvation, having anorexia nervosa and bulemia); abnormal cardiovascular or blood lipid parameters (e.g. hypertension, HDL cholesterol level upto 35 mg/dl and/or TG levels of at least 250 mg/dl and metabolic syndrome); reproductive status (e.g. pregnancy, a history of gestational diabetes and macrosomia); muscle wasting (e.g. aging, starvation, exposure to anti-gravity environments and paralysis resulting from spinal cord injury); polycystic ovary syndrome; organ disease or dysfunction (e.g. liver cirrhosis and renal disease); metabolic disturbances; endocrine disorders or endocrinopathies (e.g. hyperandrogenism, thyrotoxicosis, hyperthyroidism, insulinoma, glucagonoma, somatostatinoma, aldosteroma, Cushing's Syndrome, pheochromocytoma, acromegaly and hypercortisolemia); pathophysiologic states (e.g. infection, congenital rubella, cytomegalovirus, toxemia, uremia, sepsis and trauma); immune-mediated disease (e.g. stiff man syndrome or the production of anti-insulin receptor antibodies); drug or chemical exposure (e.g. glucocorticoids, cytokines, alpha -interferon, thyroid hormone, TNF alpha , thiazides, estrogen-containing products, beta -blockers, nicotinic acid, serotonin receptor-targeted antipsychotics or antidepressants, vacor, diazoxide, dilantin, and HIV protease inhibitors); genetic syndrome associated with diabetes (e.g. Down's Syndrome, Klinefelter's Syndrome, Wolfram's Syndrome, Freidreich's Syndrome, Huntington's chorea, Laurence-Moon-Biedl Syndrome, myotonic dystrophy, porphyria, Prader-Willi Syndrome and Alzheimer's Disease); and detrimental effects caused by the administration of prolonged, elevated doses of insulin and/or the presence of ketoacidosis) (all claimed). AB Methods are provided for use of an exendin, an exendin agonist, or a modified exendin or exendin agonist having an exendin or exendin agonist linked to one or more polyethylene glycol polymers, for example, for lowering glucagon levels and/or suppressing glucagon secretion in a subject. These methods are useful in treating hyperglucagonemia and other conditions that would be benefited by lowering plasma glucagon or suppressing glucagon secretion.
